Unit 1:ProgrammingUnit codeH/618/7388Unit typeCoreUnit level4Credit value15

Introduction

Programming involves describing processes and procedures that are derived from algorithms. The ability to program is what sets apart a developer and an end user. Typically, the role of the developer is to instruct a device (such as a computer) to carry out instructions; the instructions are known as source code and are written in a language that is converted into something the device can understand. The device executes the instructions it is given.

Algorithms help to describe the solution to a problem or task by identifying the data and the process needed to represent the problem or task *and* the set of steps needed to produce the desired result. Programming languages typically provide the representation of both the data and the process; they provide control constructs and data types (which can be numbers, words and objects, and be constant or variable). The control constructs are used to represent the steps of an algorithm in a convenient yet unambiguous fashion. Algorithms require constructs that can perform sequential processing, selection for decision making and iteration for repetitive control. Any programming language that provides these basic features can be used for algorithm representation.

This unit introduces students to the core concepts of programming along with an introduction to algorithms and the characteristics of programming paradigms. Among the topics included in this unit are: introduction to algorithms, procedural, object-orientated and event-driven programming, security considerations, the integrated development environment and the debugging process.

On successful completion of this unit, students will be able to design and implement algorithms in a chosen language in a suitable Integrated Development Environment (IDE). This IDE will be used to develop and help track any issues with the code. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Define basic algorithms to carry out an operation and outline the process of programming an application
- LO2 Explain the characteristics of procedural, object-orientated and event-driven programming
- LO3 Implement basic algorithms in code using an IDE
- LO4 Determine the debugging process and explain the importance of a coding standard.

Essential Content

LO1 Define basic algorithms to carry out an operation and outline the process of programming an application

Algorithm definition:

Writing algorithms to carry out an operation, e.g. Bubble sort.

The relationship between algorithms and code.

The generation process of code; the roles of the pre-processor, compiler and linker, interpreter.

LO2 Explain the characteristics of procedural, object-orientated and eventdriven programming

Characteristics of code:

Definitions of: data types (the role of constants/variables), data structures, e.g. arrays, stacks, queues, methods (including input/output), control structures, iteration, scope, parameter passing, classes, inheritance and events.

Key components of an IDE, with a brief explanation of each component.

Use of addition of advanced text editors to view code, such as Notepad++, Atom, Sublime Text etc.

LO3 Implement basic algorithms in code using an IDE

Implementation:

Develop simple applications that implement basic algorithms, including the features of a suitable language and IDE.

Create logical and maintainable codes.

Consideration of security concerns and how they could be solved.

Build, manage and deploy code to the relevant environment to solve the identified problems.

LO4 Determine the debugging process and explain the importance of a coding standard

Review and reflection:

Documentation of the debugging process in the IDE, with reference to watch lists, breakpoints and tracing.

Use of debugging the process to help developers fix vulnerabilities, defects and bugs in code.

Apply structured techniques to problem solving, debugging code and consider structure of programmes to identify and resolve issues.

Understand coding standards and their benefits when writing code.

Learning Outcomes and Assessment Criteria

LO1 Define basic algorithm and outline the process of		
 P1 Define an algorithm and outline the process in building an application. P2 Determine the steps taken from writing code to execution. 	M1 Analyse the process of writing code, including the potential challenges faced.	D1 Evaluate the implementation of an algorithm in a suitable language and the relationship between the written algorithm and the code variant.
LO2 Explain the characteri orientated and event-drive		
P3 Discuss what procedural, object- orientated and event- driven paradigms are; their characteristics and the relationship between them.	M2 Compare the procedural, object-orientated and event- driven paradigms used in given source code of an application.	D2 Critically evaluate the source code of an application that implements the procedural, object-orientated and event-driven paradigms, in terms of the code structure and characteristics.
LO3 Implement basic algo		
P4 Write a program that implements an algorithm using an IDE.	M3 Enhance the algorithm written, using the features of the IDE to manage the development process.	D3 Evaluate the use of an IDE for development of applications contrasted with not using an IDE.
LO4 Determine the debugging process and explain the importance of a coding standard		
P5 Explain the debugging process and the debugging facilities available in the IDE.	M4 Examine how the debugging process can be used to help develop more secure, robust applications.	D4 Evaluate the role and purpose of a coding standard and why it is necessary in a team as well as for the
P6 Explain the coding standard you have used in your code.		Individual.

Recommended Resources

This unit does not specify which programme language should be used to deliver the content – this decision can be made by the tutor.

Examples of languages that are used in industry are C#, Python, Ruby and Java, but any language that will allow students to achieve the Learning Outcomes is acceptable.

Introduction

Computer networks are the driving force behind the evolution of computer systems and allow users to access data, hardware, and services regardless of their location. Being knowledgeable about the underlying principles of networking is of vital importance to all IT professionals. Networking is an environment that is increasingly complex and under continuous development.

Complex computer networking has connected the world by groups of small networks through internet links to support global communications. It supports access to digital information any time, anywhere, using many applications like email, audio and video transmission, including the World Wide Web, and this has opened the floodgates to availability of information.

The aim of this unit is to give students a wider background knowledge of computer networking essentials, how they operate, protocols, standards, security considerations and the prototypes associated with a range of networking technologies. Students will explore a range of hardware, with related software, and will configure and install these to gain knowledge of networking systems. A range of networking technologies will be explored to deliver a fundamental knowledge of Local Area Networking (LAN), Wide Area Networking (WAN) and their evolution to form large-scale networks. Students will also explore the protocol methodologies related to IP data networks.

On successful completion of this unit, students will have gained the knowledge and skills needed to successfully install, operate and troubleshoot a small network; and the operation of IP data networks, router, switching technologies, IP routing technologies, IP services and basic troubleshooting. Supporting a range of units in the Higher National suite, this unit underpins the principles of networks for all and enables students to work towards their studies in vendor units, if applicable. Students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Examine networking principles and their protocols
- LO2 Explain networking devices and operations
- LO3 Design efficient networked systems
- LO4 Implement and diagnose networked systems.

Essential Content

LO1 Examine networking principles and their protocols

Introduction to networks:

Impact of networks on daily lives, the basic requirements of a reliable network, employment opportunities in the networking field, network common network attacks, network trends, e.g. bring your own device (BYOD).

Role of networks:

Purpose, benefits, resource implications, communications, e.g. transmission mediums, working practice, commercial opportunity, information sharing, collaboration.

System types:

Peer-based, client-server, cloud, cluster, centralised, virtualised.

Networking standards:

Conceptual models, e.g. OSI model, TCP/IP model; standards, e.g. IEEE 802.x.

Topology:

Network representation logical, e.g. ethernet, Token Ring; physical, e.g. star, ring, bus, mesh, tree.

Protocols:

Purpose of protocols; adherence, routed protocols, e.g. IPv4 (addressing, subnetting, VLSM), IPv6 (addressing); global unicast, multicast, link local, unique local, EUI 64, auto configuration, ICMP, FTP, HTTP, SMTP, POP3, SSL; management of protocols for addressing.

Wireless networks:

Explore the use and evolution and industry developments in mobile/cellular networks, including key technologies; standards for communications (3G, 4G, 5G); process of accessing and connecting to NB-IoT, GPRS and Wi-Fi networks.

Distinguish between NB-IoT and Wi-Fi AT command sets.

LO2 Explain networking devices and operations

Networking devices:

Explain the operation of server, hub, routers, switches, multilayer switch (including their operating systems, e.g. CISCO IOS, etc.), firewall, Host-based Intrusion System (HIDS), repeaters, bridges, wireless devices, access point (wireless/wired), content filter, load balancer, modem, packet shaper, VPN concentrator.

Explore the basic concepts, features and key technologies of IoT gateways, including IoT gateway solutions, industrial IoT gateway positioning, edge computing, network topologies, RF mesh, Smart Home networks, acceleration, Wi-Fi coverage and intelligent services and serial data transmission (binary data).

Networking software:

Client software, server software, client operating system, server operating system, firewall.

Server type:

Web, file, database, combination, virtualisation, terminal services server.

Server selection:

Cost, purpose, operating system requirement.

Workstation:

Hardware, e.g. network card, cabling.

System bus and local-system architecture, e.g. memory, processor, I/O devices. Permissions.

LO3 Design efficient networked systems

Bandwidth:

Expected average load, anticipated peak load, local internet availability, cost constraints, throughput.

Users:

Quality expectations, concept of system growth.

Consider what the network will be used for (purpose) according to the scenario.

Networking services and applications:

DHCP, including static vs dynamic IP addressing, reservations, scopes, leases, options (DNS servers, Suffixes), IP helper, DHCP relay, DNS records, Dynamic DNS, static and dynamic routing between multiple subnets.

Calculate IP subnet address ranges in dotted decimal and binary.

Calculate subnet masks.

Communications:

Ensuring communications are suited to devices, suited to users, supportive of lifestyle desires, supportive of commercial requirements, security requirements, quality of service needs.

Scalability:

Ability to support device growth, able to support addition of communication devices, able to cope with bandwidth use and trend changes, protocol utilisation, addressing, multiple subnets, dynamic, static routing protocols.

Selection of components:

Supporting infrastructure needs; supporting connectivity requirements.

Security:

The concept of 'secure by design' and its application to infrastructure.

Security considerations when designing a network for an identified scenario, e.g. shared data, network access, remote workers, public facing systems, internal policy.

LO4 Implement and diagnose networked systems

Devices:

Installation of communication devices, allocation of addresses, local client configuration, server configuration, server installation, security considerations.

Verification of configuration and connectivity:

Installation of internet work communication medium, ping, extended ping, traceroute, telnet, SSH.

Evidence the system meets design requirements, including security controls as required by the scenario, have been implemented.

System monitoring:

Utilisation, bandwidth needs, monitoring user productivity and security of the system. Factors affecting network performance.

Identify typical failure modes in protocols and approaches to error control.

Review network monitoring data to optimise performance and undertake root cause analysis of events and make recommendations to reduce false positives and false negatives.

Network automation:

Process of setting up software to automatically manage, configure, test, deploy, and operate network devices (physical or virtual).

Maintenance schedule:

Backups, upgrades, security, auditing.

Diagnose and resolve layer 1 problems:

Explore the E2E integrated development and testing process.

Framing, CRC, runts, giants, dropped packets, late collisions, input/output errors.

Policy review:

Bandwidth, resource availability.

Service level agreements (SLAs):

Conditions of service availability, time window for each level of service (prime time and non-prime time), responsibilities of each party, escalation procedures, and cost/service trade-offs.

Learning Outcomes and Assessment Criteria

Merit	Distinction	
LO1 Examine networking principles and their protocols		
M1 Assess common networking principles and how protocols enable the effectiveness of networked systems.	D1 Evaluate the topology and protocol suite selected for a given scenario and how it demonstrates the efficient utilisation of a networking system.	
vices and operations		
M2 Explore a range of server types and justify the selection of a server for a given scenario, regarding cost and performance optimisation.		
LO3 Design efficient networked systems		
M3 Analyse user feedback on your designs with the aim of optimising your design and improving efficiency.	D2 Critically reflect on the implemented network, including the design and decisions made to enhance the system.	
LO4 Implement and diagnose networked systems		
M4 Recommend potential enhancements for the networked systems.		
	Merit Merit Merit Merit Minor Comparison on the second operations of networked systems. Mage and operations Mage and operations Mage and operations of server types and justify the selection of a server for a given scenario, regarding cost and performance optimisation. Introduction

In the workplace, it is essential to be effective as a communicator, critical thinker, analyser, team worker and team leader. These skills are needed on a daily basis in order to carry out designated tasks as part of a job role. The development of academic competence and the continuation of lifelong learning and continuing professional development (CPD) are required to ensure that individuals have a valued set of interpersonal skills that can be applied to any situation or environment.

This unit provides a foundation for good practice in a variety of contexts. The ability to communicate effectively using different tools and mediums will ensure that practical, research, design, reporting and presentation tasks are undertaken professionally and in accordance with various communication conventions. In everyday life, the ability to apply critical reasoning and solve problems are skills that enable tasks to be completed successfully and facilitate effective decision making. Working with others in a group environment such as an academic setting or in the workplace is an integral part of everyday life. Therefore, understanding the dynamics of teams in terms of culture, roles and responsibilities will ensure that there is a better understanding and awareness of the importance and value of teamwork. Continuing professional development, self-improvement, reflective practice and working towards various goals are encouraged in the workplace through an appraisal framework. Professional development includes at higher levels of learning and the ability to demonstrate effective research skills and academic reporting skills.

This unit covers the development of communication skills and communication literacy and the use of qualitative and quantitative data to demonstrate analysis, reasoning and critical thinking. Students will carry out tasks that require working with others in a team-based scenario and planning and problem solving.

On successful completion of the unit, students will be able to demonstrate leadership skills through the dynamics of team working. Through reflective practice, they will be able to evaluate the contributions they make as an individual and those of others.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Demonstrate a range of interpersonal and transferable communication skills to a target audience
- LO2 Apply critical reasoning and thinking to a range of problem-solving scenarios
- LO3 Discuss the importance and dynamics of working within a team and the impact of team working in different environments
- LO4 Examine the need for continuing professional development (CPD) and its role within the workplace and for higher-level learning.

Essential Content

LO1 Demonstrate a range of interpersonal and transferable communication skills to a target audience

Effective communication:

Verbal and non-verbal, e.g. awareness and use of body language, openness and responsiveness, formal and informal dialogue and feedback to a range of different stakeholders, academic report writing, use of IT to enhance communication, use of source information to undertake research.

Understanding of the reasons for communicating with internal and external stakeholders, e.g. responding to queries, technical support, providing instructions, raising awareness of issues.

Considerations when communicating with internal and external stakeholders, e.g. maintaining privacy and security, tone of voice, use of technical vocabulary or jargon, company image.

Consideration of issues relating to inclusion and diversity when communicating and interacting with others.

Interpersonal skills:

Soft skills, e.g. personal effectiveness, working with others, use of initiative, negotiating skills, assertiveness skills and social skills.

Time-management skills:

Prioritising workloads, setting objectives, using time effectively, making and keeping appointments, planning and scheduling tasks and activities.

LO2 Apply critical reasoning and thinking to a range of problem-solving scenarios

Specification of the problem:

Definition of the problem; analysis and clarification.

Identification of possible outcomes:

Identification and assessment of various alternative outcomes.

Tools and methods:

Use of problem-solving methods and tools.

Demonstrate resourcefulness and creativity when solving problems.

Plan and implement:

Sources of information, solution methodologies, selection and implementation of the best corrective action, e.g. timescale, stages, resources, critical path analysis.

Evaluation:

Evaluation of problem solving, measurement of solution against specification and desired outcomes, sustainability.

LO3 Discuss the importance and dynamics of working within a team and the impact of team working in different environments

Working with others:

Nature and dynamics of team and group work, informal and formal settings.

Purpose of teams and groups, e.g. long-term corporate objectives and strategy, problem-solving and short-term development projects, flexibility and adaptability, team player.

Individual responsibility when working as part of a team.

Working effectively on individual and collaborative tasks regardless of levels of supervision.

Allocation and management of tasks between members of the team, identifying team members' strengths, communicating requirements and expectations effectively.

Teams and team building:

Selecting team members e.g. specialist roles, skill and style/approach mixes.

Identification of team and work group roles.

Stages in team development, including team building, identity, loyalty, commitment to shared beliefs, professionalism.

Team health evaluation, including promoting and maintaining a safe and secure working environment, action planning, monitoring and feedback, coaching skills, ethics.

Effective leadership skills, e.g. setting direction, setting standards, motivating, innovative, responsive, effective communicator, reliability, consistency.

LO4 Examine the need for continuing professional development (CPD) and its role within the workplace and for higher-level learning

Responsibilities:

Own responsibilities, e.g. personal responsibility, direct and indirect relationships and adaptability, decision-making processes and skills, ability to learn and develop within the work role.

Other responsibilities, including employment legislation, ethics, employment rights and responsibilities.

Maintaining a productive, professional and secure working environment.

Performance objectives:

Setting and monitoring performance objectives, measurement tools for success and achievement.

CPD, including lifelong learning, training and development, personal development, professional development.

Evidence criteria:

Production data, personnel data, judgemental data.

Rating methods, e.g. ranking, paired comparison, checklist, management by objectives.

Skills audit, including personal profile using appropriate self-assessment tools, evaluating self-management.

Personal and interpersonal skills.

Motivation and performance:

Application and appraisal of motivational theories and techniques, rewards and incentives; manager's role; self-motivational factors.

Development plan:

Plan to include current performance, future needs, opportunities and threats to career progression, aims and objectives, achievement dates, review dates, learning programme or activities, action plans, personal development plans, ongoing commitment to CPD.

Introduction

Credit value

Organisations depend on their databases for providing information that is essential for their day-to-day operations and to help them take advantage of today's rapidly growing and maturing e-commerce opportunities. An understanding of database tools and technologies is an essential skill for designing and developing systems to support them.

As applications get increasingly more sophisticated, database systems continue to demand more complex data structures and interfaces. Most organisations collect and store large volumes of data, either on their own systems or in the cloud, and this data is used not just for the operational running of their business but is also mined for other more intelligent and complex applications. Databases stand as the back-end of most systems used by organisations for their operations.

Database design and development is a fundamental and highly beneficial skill for computing students to master, regardless of their specialism.

The aim of this unit is to give students opportunities to develop an understanding of the concepts and issues relating to database design and development. It will also provide the practical skills needed to be able to translate that understanding into the design and creation of complex databases.

Topics covered in this unit are: examination of different design tools and techniques; examination of different development software options; consideration of the development features of a fully-functional robust solution covering data integrity, data validation, data consistency, data security and advanced database querying facilities across multiple tables; appropriate user interfaces for databases and for other externally linked systems; creating complex reports/dashboards, testing the system against the user and system requirements; and elements of complete system documentation. On successful completion of the unit, students will be able to use appropriate tools to design and develop a relational database system for a substantial problem. They will be able to test the system to ensure that it meets user and system requirements, and fully document the system by providing technical and user documentation. For practical purposes, this unit covers relational databases and related tools and techniques. A brief overview of object-oriented databases will also be covered. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Use an appropriate design tool to design a relational database system for a substantial problem
- LO2 Develop a fully-functional relational database system, based on an existing system design
- LO3 Test the system against user and system requirements
- LO4 Produce technical and user documentation.

Essential Content

LO1 Use an appropriate design tool to design a relational database system for a substantial problem

Database design:

Principles and uses of relational and non-relational databases.

The role of database systems, e.g. as back-end systems, in e-commerce, for data mining applications, blockchain.

Determining user and system requirements.

Design tools and techniques for a relational database system.

Logical design for relational databases, including structured data in tables, data elements, data types, indexes, primary and foreign keys, entity relationship modelling, referential integrity, data normalisation to third normal form.

Designs for data integrity, data validations, data security and data controls. User interface design.

Output designs for user requirements.

Overview of object-oriented databases and their design tools.

LO2 Develop a fully-functional relational database system, based on an existing system design

Implementation:

Consideration of database and platform options for system development.

Examination of different software development options for developing the relational database system.

Implementation of the physical data model based on the logical model and linking code to data sets.

Data stores, internal storage and external storage, e.g. the cloud.

Implementation of security elements in databases.

Relational databases with controls like data validation using; input masks, dropdown lists, option buttons.

Consideration of user interface requirements looking at functionality, reliability, consistency, performance and accessibility for a range of different users.

Develop effective user interfaces linked with other systems, e.g. internet-based applications.

Data manipulation using appropriate query tools, including complex queries to query across multiple tables and using functions and formulae.

Database maintenance and data manipulation: inserts, updates, amendments, deletions, data backup and recovery.

System reports using report-writing tools and report generators, dashboards.

Implementation of security elements in a database, including consideration of permissions, access rights, network vulnerabilities, physical location of data, multi-tenancy and data separation, encryption.

Consideration of GDPR issues, including data crossing borders and other nations' data protection regulations.

LO3 Test the system against user and system requirements

Testing methodologies:

Identify elements of the system that need to be tested. Consider data that should be used to fully test the system.

Match tests against user and system requirements.

Test procedures to be used: test plans, test models, e.g. structural testing, functional testing; testing documentation.

Functional and system testing and testing the robustness of the system, including help menus, pop-ups, hot-spots, data validation checks.

LO4 Produce technical and user documentation

Structure and functionality documentation:

Technical and user documentation and their contents.

Technical documentation to include diagrams showing movement of data through the system and flowcharts describing how the system works.

User documentation, including how to use the system, outputs produced by the system, menu operations and other functions.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Use an appropriate de relational database system		
P1 Design a relational database system using appropriate design tools and techniques, containing at least four interrelated tables, with clear statements of user and system requirements.	M1 Produce a comprehensive design for a fully-functional system, which includes interface and output designs, data validations and data normalisation.	D1 Evaluate the effectiveness of the design in relation to user and system requirements.
LO2 Develop a fully-functional relational database system, based on an existing system design		LO2 and LO3
P2 Develop the database system with evidence of user interface, output and data validations, and querying across multiple tables.	M2 Implement a fully- functional database system, which includes system security and database maintenance.	D2 Evaluate the effectiveness of the database solution in relation to user and system requirements and suggest improvements.
P3 Implement a query language into the relational database system.	meaningful data has been extracted through the use of query tools to produce appropriate management information.	
LO3 Test the system against user and system requirements		
P4 Test the system against user and system requirements.	M4 Assess the effectiveness of the testing, including an explanation of the choice of test data used.	

Pass	Merit	Distinction
LO4 Produce technical and		
P5 Produce technical and user documentation.	M5 Produce technical and user documentation for a fully-functional system, including data flow diagrams and flowcharts, describing how the system works.	D3 Evaluate the database in terms of improvements needed to ensure the continued effectiveness of the system.

Unit 41: Database Management Systems.

Unit 5:	Security
Unit code	D/618/7406
Unit type	Core
Unit level	4
Credit value	15

Introduction

Security is one of the most important challenges modern organisations face. It is about protecting organisational assets, including personnel, data, equipment and networks, from attack through the use of prevention techniques in the form of vulnerability testing/security policies and detection techniques, exposing breaches in security and implementing effective responses.

The aim of this unit is to give students knowledge of security, the associated risks and how it has an impact on business continuity. Students will examine security measures involving access authorisation and regulation of use. They will implement contingency plans and devise security policies and procedures. The unit also introduces students to detection of threats and vulnerabilities in physical and IT security, and how to manage risks relating to organisational security.

This unit includes network security design and operational topics, including address translation, DMZ, VPN, firewalls, AV and intrusion detection systems. Remote access will be covered, as will the need for frequent vulnerability testing as part of organisational and security audit compliance. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Assess risks to IT security
- LO2 Describe IT security solutions
- LO3 Review mechanisms to control organisational IT security
- LO4 Manage organisational security.

Essential Content

LO1 Assess risks to IT security

IT security risks:

Risks of unauthorised use of a system, including unauthorised removal or copying of data or code from a system, damage to or destruction of physical system assets and environment, damage to or destruction of data or code inside or outside the system, naturally occurring risks, internal and external sources of risk.

Legal restrictions on the access to data, including UK and international data laws (walled garden laws), e.g. General Data Protection Regulation (UK) (GDPR).

Organisational security, including business continuance, backup/restoration of data, audits, areas of systems to be secured, e.g. data, network, systems (hardware and software), WANs, intranets, wireless access systems, security culture and the approaches to security in the work place, operational impact of security breaches.

The concepts, main functions and features of a range of Operating Systems (OS) and their security functions and associated security features.

LO2 Describe IT security solutions

IT security solution evaluation:

Network security infrastructure, including evaluation of network address translation (NAT), demilitarized zone (DMZ), static and dynamic IP addresses.

Network performance: redundant array of inexpensive disks (RAID), Main/Standby, Dual LAN, web server balancing.

Data security, including asset management, image differential/incremental backups, storage area network (SAN) servers, encryption.

Data centre, including replica data centres, virtualisation, secure transport protocol, secure MPLS routing, segment routing and remote access methods/procedures for third-party access, physical mechanisms, e.g. air flow and cooling to prevent overheating.

Security vulnerability, including logs, traces, honeypots, data mining algorithms, vulnerability testing, zero-day exploits.

Educating staff and customers on IT security issues and prevention methods.

Understand how cyber security technology components are typically deployed in digital systems to provide security and functionality, including hardware and software to implement security controls.

LO3 Review mechanisms to control organisational IT security

Mechanisms to control organisational IT security:

Risk assessment and integrated enterprise risk management: network change management, audit control, business continuance/disaster recovery plans, potential loss of data/business, intellectual property, hardware and software.

Probability of occurrence, e.g. disaster, theft.

Staff responsibilities.

Legal mechanisms, both UK and international, including Data Protection Act 2018, Computer Misuse Act 1990 and amendments, ISO 31000 Risk Management standards.

Company regulations: site or system access criteria for personnel; physical security types, e.g. biometrics, swipe cards, theft prevention.

Awareness of common security architectures and methodologies that incorporate hardware and software components, and sources of architecture patterns and guidance.

Assess the security culture within an organisation (the approach to security, including how user actions impact on security).

Ensure system defences are informed by the most up-to-date legislation and guidance on best practice from professional bodies.
LO4 Manage organisational security

Manage organisational security:

Organisational security policies, e.g. system access, access to internet email, access to internet browser, development/use of software, physical access and protection, third-party access, business continuity, responsibility matrix.

Reviewing and monitoring of security risk assessments and ensuring stakeholder compliance with security procedures and standards.

Collect information from various sources (e.g. log files, system monitoring tools, Secure Information and Event Management (SIEM) tools, access control systems, physical security systems) and compare to known threat and vulnerability data to determine a digital system security breach.

Using enterprise risk management (as part of system management and lifecycle) for identifying, evaluating, implementing and follow up of security risks according to ISO 31000 standards.

Understand appropriate security tools and methods, e.g. user log-on profiles to limit user access to resources, online software to train and update staff.

Auditing tools to monitor resource access, security audits and penetration testing.

Investigate organisation policy on ethical hacking and bug bounties.

Gathering and recording information on security and initiating suitable actions for remediation.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Assess risks to IT security		LO1 and LO2
 P1 Discuss types of security risks to organisations. P2 Assess organisational security procedures. 	M1 Analyse the benefits of implementing network monitoring systems with supporting reasons.	D1 Evaluate a range of physical and virtual security measures that can be employed to ensure the integrity of organisational IT security.
LO2 Describe IT security solu	utions	
P3 Discuss the potential impact to IT security of incorrect configuration of firewall policies and third-party VPNs.	M2 Propose a method to assess and treat IT security risks.	
P4 Discuss, using an example for each, how implementing a DMZ, static IP and NAT in a network can improve network security.		
LO3 Review mechanisms to control organisational IT security		
 P5 Review risk assessment procedures in an organisation. P6 Explain data protection processes and regulations as applicable to an organisation. 	 M3 Summarise an appropriate risk-management approach or ISO standard and its application in IT security. M4 Analyse possible impacts to organisational security resulting from an IT security audit. 	D2 Recommend how IT security can be aligned with an organisational policy, detailing the security impact of any misalignment.

Pass	Merit	Distinction
LO4 Manage organisational security		
P7 Design a suitable security policy for an organisation, including the main components of an organisational disaster recovery plan.	M5 Justify the security plan developed giving reasons for the elements selected.	D3 Evaluate the suitability of the tools used in the organisational policy to meet business needs.
P8 Discuss the roles of stakeholders in the organisation in implementing security audits.

Unit 6:Planning a Computing Project
(Pearson-set)Unit codeH/618/7407Unit typeCoreUnit level4Credit value15

Introduction

This unit is assessed through a Pearson-set assignment. The project brief will be set by the centre, based on a theme provided by Pearson (this will change annually). The theme and chosen project within the theme will enable students to explore and examine a relevant and current topical aspect of computing in the context of a business environment.

As computing systems and technologies continually develop so do the ways in which businesses utilise technologies to support their operations and remain competitive. As a computing professional it is important to understand the ways in which technology evolves and how it can be utilised in different sectors.

The aim of this unit is to give students an opportunity to demonstrate the research skills required for developing a deeper understanding of a subject and the ability to use evidence to inform decisions. Students will undertake independent research, and investigation of a theme set by Pearson. Students will also investigate and research an industry sector as outlined in the centre-set project brief. Students will use the outcomes of their research to help them plan a computer-based project and to support recommendations for how the identified business could utilise the tools and technologies identified as part of their research.

On successful completion of this unit, students will have the confidence to engage in decision making, problem solving, research activities and project planning tasks. They will have the fundamental knowledge and skills that will enable them to investigate and examine relevant computing concepts in a work-related context, determine appropriate outcomes, decisions or solutions and present evidence to various stakeholders in an acceptable and understandable format.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Conduct small-scale research, information gathering and data collection to generate knowledge on an identified subject
- LO2 Explore the features and business requirements of organisations in an identified sector.
- LO3 Produce project plans based on research of the chosen theme for an identified organisation
- LO4 Present your project recommendations and justifications of decisions made, based on research of the identified theme and sector.

Essential Content

LO1 Conduct small-scale research, information gathering and data collection to generate knowledge on an identified subject

Project execution phase:

Selecting appropriate methods of information gathering, data collection and material resourcing.

The distinct phases that support a coherent and logical argument. Use of secondary research to inform a primary empirical study.

Qualitative and quantitative research methods.

Field work:

Selecting a sample of the consumer market, businesses or individuals (those who meet certain characteristics relevant to the research theme) used to gather data (qualitative or quantitative).

Sampling approaches and techniques, including probability and non-probability sampling.

Analysing information and data:

Using data collection tools, such as interviews and questionnaires, and their advantages and disadvantages.

Using analytical techniques such as trend analysis, coding and typologies.

Sources of, and access to, data, including open and public data, administrative and sensitive data, research data.

The principles of data to govern data, including data has value, data should be reusable, data is managed according to its value, data should be fit for purpose.

Ethics, reliability and validity:

Ensure that all research is conducted, data stored, processed and used in an ethical way.

Research should also be reliable (similar results achieved from a similar sample) and valid (the research should measure what it aimed to measure).

Ensure validity and reliability of secondary data and information used, including consideration of who wrote or collected the information or data, age of data collected, original purpose of the data collection, potential errors or variability in the data, potential bias, e.g. sample size, sample participants, questions used, interpretation of results.

LO2 Explore the features and business requirements of organisations in an identified sector

Features of businesses:

Types of business, their ownership and liability.

Private, e.g. sole trader, private limited company, public limited company.

Public, e.g. government department, not-for-profit, e.g. charity, voluntary.

Industry sectors, including primary, secondary, tertiary, quaternary.

How an organisation may provide a specific product(s) or service within a sector.

How some organisations provide both products and services.

The concept of diversification to aid business success.

Operational areas of businesses:

The operational areas of a business ('business functions') and how they support the organisation's purpose, e.g. human resources, research and development, sales, marketing, purchasing, production and quality, finance, customer service, IT, administration.

Stakeholders:

Internal stakeholders, e.g. management, employees, shareholders.

External stakeholders, e.g. suppliers, customers, government agencies, communities.

How stakeholders influence business processes and decisions.

The impact of stakeholders on an organisation's success.

Challenges to the success of a business:

Legislation and industry standards relevant to the organisation and sector.

Change management, including planned change, e.g. expansion, diversification, changes in legislation, system upgrades.

Unplanned change, e.g. response to a security breach, disaster response and recovery.

Communication of need for change to stakeholders.

Management of stakeholders before during and after change, e.g. training, target setting, support

Method of implementation of change, e.g. parallel running, direct change over, phased changeover.

Documenting the change process, testing changes to the system and business.

Security and privacy concerns relevant to the organisation and sector.

LO3 Produce project plans based on research of the chosen theme for an identified organisation

Project planning and initiation:

The role of a business or systems analyst and the activities they undertake as part of initiation of a project.

Analysing the features and requirements of an identified organisation to establish their requirements.

Recommend potential solutions to identified business needs, including carrying out a cost/benefit analysis, defining business objectives, scope and purpose of the project.

Comprehensive project plans, including defining functional and non-functional requirements of the system, stakeholder requirements and expectations, carrying out impact analysis, prioritising requirements, describing the deliverables to be produced, timescales and time management, costs, change management planning, risk and challenges analysis.

Success criteria to be used, e.g. Key Performance Indicators (KPIs), performance metrics, quality metrics, and business targets.

Use of an identified project management methodology, e.g. Waterfall, Agile, Rapid Application Development (RAD).

Consider approaches to continuous integration, version and source control.

Tools:

Tools for effective project planning, resource planning and allocation, and work breakdown structure, including Project Initiation Documents (PID), bar and Gantt charts, Critical Path Analysis (CPA), risk matrix.

LO4 Present your project recommendations and justifications of decisions made based on research of the identified theme and sector

Presenting and communicating project recommendations:

Presenting to different technical and non-technical stakeholders, e.g. emphasis on operational or strategic information, technical terminology used, levels of detail given and simplifying concepts.

Consider the methods and mediums to be used, including written or verbal, report, online or presentation.

Understand how project research and intended audience will influence on method and medium.

Justification of decisions made:

Justification of recommendations, including use of key points from cost/benefit analysis, deliverables, success criteria, impact analysis.

Justifications of planning, including chosen development methodology, work and resource allocation, key deadlines and timescales.

Rationale for decisions made in the recommended solution and project plan, including use of research and data for the identified technology and business sector, analysis of evidence and business requirements, contextual factors specific to the identified organisation.

Reflection on the quality of research:

Quality of secondary and primary data used to inform planning and make decisions.

Awareness that some studies may result in generalised findings and how this can impact on the quality of decisions and the accuracy of conclusions made.

Evaluate the quality of the data and information used to inform project initiation plans, e.g. sample size, sample characteristics, user experience during collection, domain context.

Reach conclusions as to the likely accuracy and reliability of assertions made.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Conduct small-scale rese and data collection to genera identified subject	earch, information gathering te knowledge on an	LO1 and LO2
 P1 Demonstrate qualitative and quantitative research methods to generate relevant primary data for an identified theme. P2 Examine secondary sources to collect relevant secondary data and information for an identified theme. 	M1 Analyse data and information from primary and secondary sources to generate knowledge on an identified theme.	D1 Interpret findings to generate knowledge on how the research theme supports business requirements in the identified sector.
LO2 Explore the features and organisations in an identified	business requirements of sector	
P3 Discuss the features and operational areas of a businesses in an identified sector.	M2 Analyse the challenges to the success of a business in an identified sector.	
P4 Discuss the role of stakeholders and their impact on the success of a business.		

Pass	Merit	Distinction
LO3 Produce project plans based on research of the chosen theme for an identified organisation		LO3 and LO4
P5 Devise comprehensive project plans for a chosen scenario, including a work and resource allocation breakdown using appropriate tools.	M3 Produce comprehensive project plans that effectively consider aims, objectives and risks/benefits for an identified organization.	D2 Evaluate the project planning recommendations made in relation to the needs of the identified organisation and the accuracy and reliability of the research
LO4 Present your project recommendations and justifications of decisions made, based on research of the identified theme and sector		carried out.
 P6 Communicate appropriate project recommendations for technical and non- technical audiences. P7 Present arguments for the planning decisions made when developing the project plans. P8 Discuss accuracy and reliability of the different research methods applied. 	M4 Assess the extent to which the project recommendations meet the needs of the identified organisation, including fully- supported rationales for planning decisions made.

Unit 7:Software Development
LifecyclesUnit codeK/618/7408Unit level4Credit value15

Introduction

The software development lifecycle is an integrated process that promotes building good quality, secure software throughout the entire development process. The aim of this unit is to give students the knowledge and skills needed to understand software development lifecycles so that they can demonstrate their knowledge by implementing a software development lifecycle with a suitable methodology.

The unit introduces students to lifecycle decision making at different stages of the software development process. They will examine various lifecycle models and learn to appreciate their particular characteristics in order to understand for which project environments they are most appropriate. Theoretical understanding will be translated into practical skills through an actual software development lifecycle project. Students will become confident in the use of particular tools and techniques relevant to a chosen methodology.

Among the topics included in this unit are iterative and sequential models of software development lifecycles and reference frameworks for initially capturing conceptual data and information through a feasibility study, and requirement gathering techniques through to analysis, design and software implementation activities.

Students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Describe different software development lifecycles
- LO2 Explain the importance of a feasibility study
- LO3 Undertake a software development lifecycle
- LO4 Discuss the suitability of software behavioural design techniques.

Essential Content

LO1 Describe different software development lifecycles.

Software development lifecycles:

Describe different software development lifecycles.

Understand and use different lifecycle models, including predictive (Waterfall, Prototyping, RAD), adaptive (Spiral, Agile, DSDM), sequential and iterative software development models.

Lifecycle stage and connectivity, including feasibility study, analysis, design, implementation, testing, review or analysis, design, implementation, maintenance, planning, requirements traceability.

Testing and integration, including relationship between test activities and software development activities, levels of testing, building test environments, developing test harnesses, functional and structural testing, incremental testing, system testing, acceptance test and integration approaches, changeover strategies, trials and Go-Live prerequisites.

Understand the role and utilisation of analysis artefacts:

The creation of analysis artefacts in a software development project, e.g. software requirements specification, use case or user stories, user profiles, workflow model, wireframes, logical data model, data dictionary etc.

The purpose and activities of the gap analysis process.

Roles and responsibilities in a large-scale software project development lifecycle:

Identify the different individuals in a project, e.g. project manager, business analyst, systems analyst, programmer, DevOps engineer, testing engineer etc.

Contributions, including quality assurance, common core skills, tools and behaviours.

Explore how the psychology and mindset of testing differs to that development mindset and their possible influence on the overall success of a software project.

LO2 Explain the importance of a feasibility study

Requirement gathering:

Requirement gathering techniques, including how to categorise, validate and prioritise, e.g. MosCow method, functional requirements, non-functional requirements, users and constraints.

Interviews, observation, investigation.

Importance of feasibility study:

Feasibility criteria considerations, e.g. legal, social, economic, technical, timescales, organisational constraints.

Components of feasibility study, including purpose, structure, intended audience, outcomes.

The purpose of process modelling and the importance of an organisational view of business processes.

Key drivers for change, including performance and efficiency, legacy systems upgrade, automation, elimination of human error.

LO3 Undertake a software development lifecycle

Carry out software development lifecycle:

Follow company, team or client approaches to continuous integration, version and source control.

Apply an appropriate software development approach according to the relevant paradigm, e.g. object oriented, event driven or procedural.

Identify stakeholder requirements.

Scope of project, including inputs, outputs, processes and process descriptors, consideration of alternate solutions and security considerations, required quality assurance and testing.

Constraints specific to activity, e.g. costs, organisational policies, legacy systems, hardware requirements.

Create simple software designs to effectively communicate understanding of the program.

Follow agreed software designs and technical and functional specifications.

Follow organisational policies and procedures relating to the tasks being undertaken, e.g. the storage and treatment of GDPR sensitive data. Report documentation, including structure, e.g. background information, problem statements, data collection process and summary, recommendations and appendices.

Use of appropriate systems analysis terminology and tools, including data stores and entities, data flows, process representation techniques relationships (1:1, 1:M and M:M).

Investigation, e.g. upgrading computer systems, designing new systems.

Techniques and documents for documenting business requirements and processes relevant to selected methodology, e.g. Context Diagrams, Data Flow Diagrams (DFDs), Entity Relationship Diagrams (ERDs), Business Systems Options (BSOs), Technical Systems Options (TSOs) and requirements traceability.

Analyse documented requirements to remove duplication, conflict and overlap.

Quality considerations, e.g. Total Quality Management (TQM).

LO4 Discuss the suitability of software behavioural design techniques

Evaluate suitability of software behavioural design techniques:

Flowcharts, pseudocode, formal specification methods, event/state/data driven, finite state machines extended-FSM/FSP.

Problem of e-FSM state explosion, reachability analysis, safety, liveness properties.

Automatic analysis and animation tools.

Understand the characteristics of software architecture that impact on software testing in the development lifecycle.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Describe different software development lifecycles		
 P1 Describe two iterative and two sequential software lifecycle models. P2 Explain how risk is managed in software lifecycle models. 	M1 Discuss using an example, why a particular lifecycle model is selected for a development environment.	D1 Assess the merits of applying the Waterfall lifecycle model to a large software development project.
LO2 Explain the importance of	of a feasibility study	
 P3 Explain the purpose of a feasibility report. P4 Describe how technical solutions can be compared. 	M2 Discuss the components of a feasibility report.	D2 Assess the impact of different feasibility criteria on a software investigation.
LO3 Undertake a software de	evelopment lifecycle	
 P5 Undertake a software investigation to meet a business need. P6 Use appropriate software analysis tools/techniques to carry out a software investigation and create supporting documentation. 	 M3 Analyse how software requirements can be traced throughout the software lifecycle. M4 Discuss two approaches to improving software quality. 	D3 Evaluate the process of undertaking a systems investigation with regard to its effectiveness in improving a software quality.
LO4 Discuss the suitability of design techniques	software behavioural	
P7 Discuss, using examples, the suitability of software behavioural design techniques.	 M5 Analyse a range of software behavioural tools and techniques. M6 Differentiate between a finite state machine (FSM) and an extended FSM, providing an application of use for both. 	D4 Present justifications of how data-driven software can improve the reliability and effectiveness of software.

Unit code	R/618/7421	
Unit level	4	
Credit value	15	

Introduction

In 1837, English mathematicians Charles Babbage and Ada Lovelace in collaboration, described a machine that could perform arithmetical operations and store data in memory units. This design of their 'Analytical Engine' is the first representation of modern, general-purpose computer technology. Although modern computers have advanced far beyond Babbage and Lovelace's initial proposal, they still rely fundamentally on mathematics for their design and operation.

This unit introduces students to the mathematical principles and theory that underpin the computing curriculum. Through a series of case studies, scenarios and task-based assessments, students will explore number theory in a variety of scenarios; use applicable probability theory; apply geometrical and vector methodology; and, finally, evaluate problems concerning differential and integral calculus.

Among the topics included in this unit are: prime number theory, sequences and series, probability theory, geometry, differential calculus and integral calculus.

On successful completion of this unit, students will have gained confidence in the mathematics that is needed in other computing units. They will have developed skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Use applied number theory in practical computing scenarios
- LO2 Analyse events using probability theory and probability distributions
- LO3 Determine solutions of graphical examples using geometry and vector methods
- LO4 Evaluate problems concerning differential and integral calculus.

Essential Content

LO1 Use applied number theory in practical computing scenarios

Number theory:

Converting between number bases (denary, binary, octal, duodecimal and hexadecimal).

Prime numbers, Pythagorean triples and Mersenne primes. Greatest common divisors and least common multiples.

Modular arithmetic operations.

Sequences and series:

Expressing a sequence recursively.

Arithmetic and geometric progression theory and application. Summation of series and the sum to infinity.

LO2 Analyse events using probability theory and probability distributions

Probability theory:

Calculating conditional probability from independent trials. Random variables and the expectation of events.

Applying probability calculations to hashing and load balancing.

Probability distributions:

Discrete probability distribution of the binomial distribution.

Continuous probability distribution of the normal (Gaussian) distribution.

LO3 Determine solutions of graphical examples using geometry and vector methods

Geometry:

Cartesian co-ordinate systems in two dimensions. Representing lines and simple shapes using co-ordinates. The co-ordinate system used in programming output device.

Vectors:

Introducing vector concepts.

Cartesian and polar representations of a vector. Scaling shapes described by vector co-ordinates.

LO4 Evaluate problems concerning differential and integral calculus

Differential calculus:

Introduction to methods for differentiating mathematical functions. The use of stationary points to determine maxima and minima.

Using differentiation to assess rate of change in a quantity.

Integral calculus:

Introducing definite and indefinite integration for known functions. Using integration to determine the area under a curve.

Formulating models of exponential growth and decay using integration methods.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Use applied number theory in practical computing scenarios		
 P1 Calculate the greatest common divisor and least common multiple of a given pair of numbers. P2 Use relevant theory to sum arithmetic and geometric progressions. 	M1 Identify multiplicative inverses in modular arithmetic.	D1 Produce a detailed written explanation of the importance of prime numbers in the field of computing.
LO2 Analyse events using probability theory and probability distributions		
P3 Deduce the conditional probability of different events occurring in independent trials.	M2 Calculate probabilities in both binomially distributed and normally distributed random variables.	D2 Evaluate probability theory to an example involving hashing and load balancing.
P4 Identify the expectation of an event occurring from a discrete, random variable.		
LO3 Determine solutions of geometry and vector method	graphical examples using ds	
 P5 Identify simple shapes using co-ordinate geometry. P6 Determine shape parameters using appropriate vector methods 	M3 Evaluate the co-ordinate system used in programming a simple output device.	D3 Construct the scaling of simple shapes that are described by vector co-ordinates.

Pass	Merit	Distinction
LO4 Evaluate problems concerning differential and integral calculus		
 P7 Determine the rate of change in an algebraic function. P8 Use integral calculus to solve practical problems involving area. 	M4 Analyse maxima and minima of increasing and decreasing functions, using higher order derivatives.	D4 Justify, by further differentiation, that a value is a minimum.

Unit 16:Computing Research Project
(Pearson-set)Unit codeK/618/7425Unit typeCoreUnit level5Credit value30

Introduction

This unit is assessed through a Pearson-set assignment. Students will choose their own project based on a theme provided by Pearson (this will change annually). The project must be related to their specialist pathway of study (unless the student is studying the general computing pathway). This will enable students to explore and examine a relevant and current topical aspect of computing in the context of a business environment and their chosen specialist pathway.

The aim of this unit is to give students the opportunity to engage in sustained research in a specific field of study. Students will be able to demonstrate the capacity and ability to identify a research theme, to develop research aims, objectives and outcomes, and to present the outcomes of such research in both written and verbal formats. Students are encouraged to reflect on their engagement in the research process, during which recommendations for personal development are key learning points.

On successful completion of this unit, students will have the confidence to engage in problem-solving and research activities. Students will have fundamental knowledge and skills that will enable them to investigate workplace issues and problems, determine appropriate solutions and present evidence to various stakeholders in an acceptable and understandable format.

Students will have developed skills such as communication literacy, critical thinking, analysis, synthesis, reasoning, and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Examine appropriate research methodologies and approaches as part of the research process
- LO2 Conduct and analyse research relevant to a computing research project
- LO3 Communicate the outcomes of a research project to identified stakeholders
- LO4 Reflect on the application of research methodologies and concepts.

Essential Content

LO1 Examine appropriate research methodologies and approaches as part of the research process

Developing a research proposition:

The importance of developing methodical and valid propositions as the foundation for a research project.

Rationale: the purpose and significance for research question or hypothesis.

The value of the philosophical position of the researcher and the chosen methods.

Use of Saunders' Research Onion as a guide to establishing a methodological approach.

Literature review:

Conceptualisation of the research problem or hypothesis.

The importance of positioning a research project in context of existing knowledge.

Significance and means of providing benchmarks by which data can be judged.

Qualitative, quantitative, and mixed method research methodologies:

Key theoretical frameworks for research.

Advantages and limitations of qualitative and quantitative research approaches and methods.

LO2 Conduct and analyse research relevant to a computing research project

Research as a process:

Follow distinct phases of research to support a coherent and logical argument including using secondary research to inform a primary, empirical study.

Identify the reason and goal of the business research project, e.g. solving identified problems, business expansion, improve competitiveness, response to developments in technology, changes in the industry.

Elicite information from stakeholders.

Application of key skills and behaviours to guide the research project and ensure success, e.g. critical thinking, analysis and reasoning, dealing with difficult situations, misunderstanding or mistakes.

Selecting a sample:

The importance of gathering primary and secondary data and information (qualitative or quantitative) to support research analysis.

Selecting sample types and sizes that are relevant to the research.

Considering sampling approaches and techniques, including probability and non-probability (random) sampling.

Ethics, reliability and validity:

Conduct research ethically including reporting of findings.

Consider how to ensure reliable and valid research.

Analysing data:

Using data collection tools such as interviews and questionnaires.

Using analytical techniques such as trend analysis, coding and typologies.

LO3 Communicate the outcomes of a research project to identified stakeholders

Stakeholders:

Techniques to support the identification and analysis of internal and external stakeholders.

Stakeholder analysis to determine approaches to communications, including who the stakeholders are, high and low priority status, type of communication, frequency of communication, level to which the project outcomes are conveyed.

Communicating research outcomes:

Consideration of different methods of communicating outcomes, e.g. written word, spoken word, and the medium, e.g. report, online, presentation. The method and medium will be influenced by the research and its intended audience.

Considerations when communicating with stakeholders, e.g. maintaining privacy and security, tone of voice, use of technical vocabulary or jargon, maintaining or promoting company image.

Convincing arguments:

No matter what the method/medium, all research should be convincing and presented logically where the assumption is that the audience has little or no knowledge of the research process.

The importance of developing evaluative conclusions.

LO4 Reflect on the application of research methodologies and concepts

Reflection for learning and practice:

Difference between reflecting on performance and evaluating a research project. The former considers the research process; the latter considers the quality of the research argument and use of evidence.

Reflection on the merits, limitations and potential pitfalls of the chosen methods.

The cycle of reflection:

To include reflection in action and reflection on action.

Considering how to use reflection to inform future behaviour and future considerations.

Reflective writing:

Avoiding generalisation and focusing on personal development and the research journey in a critical and objective way.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine appropriate re approaches as part of the re	esearch methodologies and esearch process	LO1 and LO2
 P1 Produce a research proposal that clearly defines a research question or hypothesis, supported by a literature review. P2 Examine appropriate research methods and approaches to primary and secondary research. 	M1 Analyse different research approaches and methodology and make justifications for the choice of methods selected based on philosophical/theoretical frameworks.	D1 Critically evaluate research methodologies and processes in application to a computing research project to justify chosen research methods and analysis.
LO2 Conduct and analyse re computing research project	search relevant to a	
 P3 Conduct primary and secondary research using appropriate methods for a computing research project that consider costs, access and ethical issues. P4 Apply appropriate analytical tools analyse 	M2 Discuss merits, limitations and pitfalls of approaches to data collection and analysis.	
research findings and data.		

Pass	Merit	Distinction
LO3 Communicate the outcomes of a research project to identified stakeholders		
P5 Communicate research outcomes in an appropriate manner for the intended audience.	M3 Analyse the extent to which outcomes meet set research objectives and communicate judgements effectively for the intended audience	D2 Evaluate outcomes and make valid, justified recommendations.
LO4 Reflect on the application of research methodologies and concepts		
P6 Discuss the effectiveness of research methods applied, for meeting objectives of the computing research project.	M4 Analyse results in recommended actions for improvements and future research considerations.	D3 Demonstrate reflection and engagement in the resource process, leading to recommended actions for future improvement.
P7 Discuss alternative research methodologies and lessons learnt in view of the outcomes.

Introduction

Data and information are core to any organisation and business process. Accurate data and meaningful information are of high value to an organisation and are key drivers for effective decision making and problem solving. Business intelligence relies on the use of data science, which makes use of a range of tools and methods, including data mining, data integration, data quality and data warehousing, in conjunction with other information management systems and applications.

This unit introduces students to a range of tools, techniques and technologies used for acquiring data and processing it into meaningful information that can be used to support business functions and processes.

Students will examine how data and information support business processes, the mechanisms to source and utilise data and turn it in to usable, and valuable, information output. Students will explore real-world business problems, the emergence of data science and how the application of data science can be used to support business processes. Finally, students will demonstrate practical application of data science techniques to support real-world business problems.

On successful completion of this unit, students will appreciate the importance and value of data and information in terms of optimising decision making and performance. By exploring the tools, techniques and systems that support business processes, students will be aware of the role and contribution of these technologies and methodologies, and their importance to organisations. As a result, students will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Discuss the use of data and information to support business processes and the value they have for an identified organisation
- LO2 Discuss the implications of the use of data and information to support business processes in a real-world scenario
- LO3 Explore the tools and technologies associated with data science and how it supports business processes
- LO4 Demonstrate the use of data science techniques to make recommendations to support real-world business problems.

Essential Content

LO1 Discuss the use of data and information to support business processes and the value they have for an identified organisation

Data and information in organisations:

Value of data and information for an organisation, including decision making (strategic, tactical and operational), deliver and improve services, optimise workflow and efficiency, increase profit margins, diversification, reduce overheads.

Types of data used by organisations, including structured and unstructured data.

Impact on business processes in terms of elicitation and storage.

The importance of reliable data and impact on businesses.

Use of data and information to support business processes:

Analysing market trends to identify patterns.

Factors impacting fluctuations in supply and demand, and prices of goods.

Monitoring system performance metrics.

Monitoring and controlling the quality of a product or service.

Analysing levels of user or customer interaction and engagement.

Analysing trends in browsing and purchasing for targeted marketing purposes.

Mechanisms:

Data generation, including human generated, e.g. social media posts, documents and files, email and text messages, website content.

Machine generated data, e.g. sensor readings, log files, system performance metrics, transactional data.

Tools to collect, store, manage, analyse and display data and information, including application software, content management systems, social media platform analytics tools, databases, scripting languages.

LO2 Discuss the implications of the use of data and information to support business processes in a real-world scenario

Social, legal and ethical implications:

Recognise the social, ethical and professional issues related to the use of data and information to support business processes, e.g. how data and information is collected and used, use of cookies and other transactional data, sharing of data, e.g. between departments, services and organisations.

Legal and regulatory issues related to the use of data and information to support business processes in reference to current legislation and principles of good practice, as recommended by computing professional bodies.

Cybersecurity management:

Common threats to data and information, e.g. internal and external threats.

Impact of human behaviour on cyber security, e.g. how motive and opportunity combine to become a threat.

Concept of 'secure by design' when developing and using systems to handle data and information.

Ways to mitigate common threats to data and information at personal and organisational level.

Organisational implications of failing to adequately protect data and information, e.g. legal actions, financial impact, disruption of operations and reduction in productivity, damage to public image.

LO3 Explore the tools and technologies associated with data science and how it supports business processes

Data science overview:

Explore how the exponential growth of the amount of data generated impacts on the way data is collected and used.

The core aims of data science, including making data useful and retrievable, extracting actionable intelligence to improve business performance, automating extraction and implementation.

Key job roles, including data engineer and data scientist, and how they work with other members of a team, e.g. senior managers, business and data analysts, software engineers in change and development lifecycles. Data-science-related skills, including mathematics and statistics, programming and scripting skills, investigation and integration of data, core business knowledge.

Sub-disciplines in the data science field, including data engineering, machine learning and artificial intelligence.

Using data:

Core data handling techniques and concepts, including input and capture, data processing and conversion, information output and security considerations.

Forms of data, including unstructured and semi-structured data, and implications on use and analysis.

Data types, e.g. date, integer, real, character, string, Boolean.

Format of source and target data files, e.g. JSON, fixed-width text file, CSV, ASCII, XML.

The use of coding and scripting languages to automate data science processes, e.g. Python, R.

Turning data into usable information, including data mining techniques to find anomalies, cluster patterns and relationships between data sets, web scraping, descriptive and predictive analysis, converting data into visual information, e.g. charts, graphs, histograms, other visual mediums.

Predictive modelling, e.g. forecasting, use of statistical models to predict and identify trends.

Communicating information effectively to a range of stakeholders.

LO4 Demonstrate the use of data science techniques to make recommendations to support real-world business problems

Solutions:

Supporting a business process, including techniques to elicit end user requirements, systems requirements, application to automate procedures, including when it is most appropriate to use each one.

Designing a tool, program or package that can perform a specific task to support problem solving or decision making, e.g. e-commerce function for a website to support purchase analysis, a user dashboard to investigate specific market trends, optimising delivery routes for a logistics company.

Analysing and modelling business processes using relevant techniques, standards, notation and software tools.

Design considerations:

Addressing user and system requirements, e.g. user-friendly and functional interface, considering user engagement and interaction, quality risks inherent in data, mitigate or resolve risks, meaningful data output, customisation to satisfy the user and system requirements, phases of testing of business system changes.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Discuss the use of data business processes and the identified organisation	and information to support value they have for an	LO1 and LO2
 P1 Discuss how data and information support business processes and the value they have for organisations. P2 Discuss how data is generated and the tools used to manipulate it to form meaningful data to support business operations. 	M1 Assess the value of data and information to individuals and organisations in relation to real-world business processes.	D1 Evaluate the wider implications of using data and information to support business processes in an identified organisation.
LO2 Discuss the implications of the use of data and information to support business processes in a real-world scenario		
P3 Discuss the social legal and ethical implications of using data and information to support business processes.	M2 Analyse the impact of using data and information to support business real-world business processes.	
P4 Describe common threats to data and how they can be mitigated at on a personal and organisational level.		

Pass	Merit	Distinction
LO3 Explore the tools and te data science and how it supp	chnologies associated with ports business processes	LO3 and LO4
P5 Discuss how tools and technologies associated with data science are used to support business processes and inform decisions.	M3 Assess the benefits of using data science to solve problems in real-world scenarios.	D2 Evaluate the use of data science techniques against user and business requirements of an identified organisation.
LO4 Demonstrate the use of data science techniques to make recommendations to support real-world business problems		
 P6 Design a data science solution to support decision making related to a real-world problem. P7 Implement a data science solution to support decision making related to a real-world problem. 	M4 Make justified recommendations that support decision making related to a real-world problem.

Introduction

What makes a great game? Although it's easy to say, 'This is a great game' when your character has just cleared a zone and your friend's voice buzzes in your headset letting you know that everybody is waiting for you to join the party – then another player interrupts, suggesting tactics to take down the next objective. It is a completely different story, however, when you (the designer) are sitting, staring at a blank sheet of paper and your producer is expecting you to present 'The next big title'.

This unit introduces students to an exploration of the practices, principles and skills needed to successfully design a game. The unit starts by establishing an overall history of games and reviews, and how they have evolved – and still are evolving. Students are introduced to assessing common game features and identifying the roles and responsibilities of people involved in game design, and its challenges. Students will become familiar with a range of standard documents associated with games design, including the 'Game Design Document'. Before they embark on defining, designing and documenting their own game ideas they are given opportunities to work in groups to debate and review the elements of game design. They will be introduced to the design process as well as the practices, principles, tools and techniques. As students progress, they are given opportunities to evolve their ideas through peer review, before finally presenting a 'High Concept' pitch. To help maximise student involvement, this unit should (where possible) simulate a real-world design experience.

Among the topics included in this unit are: design documentation, research, requirement gathering, idea generation, world design, storyboards, storytelling, characters, levels, gameplay, assets and asset management, tools and techniques, game engines and environments, genres, game mechanics, player motivation and challenge, rewards, game structure, game design vocabulary and preparing and presenting a pitch.

On successful completion of this unit, students will be able to critically assess the types, practices, principles and skills used in the design of games, analyse the concepts and elements required for the production of a Games Design Document, evaluate the game design process with regard to game development and production, and use game design practices and principles to create an original Game Design Document and present a High Concept pitch. As a result, they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Critically assess the types, practices, principles and skills used in the design of games
- LO2 Analyse the concepts and elements required for the production of a Games Design Document
- LO3 Evaluate the game design process with regard to game development and production
- LO4 Use game design practices and principles to create an original Game Design Document and present a High Concept pitch.

Essential Content

LO1 Critically assess the types, practices, principles and skills used in the design of games

Game design and game types:

Identify what game design is and explore the evolution of games over time.

Research and assess game types, trends, player features, control and technology.

Practices, principles and skills used in the design of games:

Identify the role of a games designer and introduce concepts related to the game design process (including High Concept, story and art bible, design document).

Discuss idea generation, world design, storytelling, characters, levels, gameplay, assets and asset management.

Assess the skills needed to successfully design a video game.

LO2 Analyse the concepts and elements required for the production of a Games Design Document

Games Design Document structure:

Review different Game Design Documents and identify common and shared factors.

Discuss, compare and synthesise your identified factors into an agreed format.

Concepts and elements required for a Games Design Document:

Examine the purpose of the Game Design Document (including game loops such as core, dual and compulsion as well as the principles of Metagame design) and identify the stakeholders and their possible expectations.

Debate the content, depth and quality of information expected in a Games Design Document (including age-appropriate content and content ratings).

Explain the strengths and possible weaknesses of a Games Design Document.

LO3 Evaluate the game design process with regard to game development and production

Roadmap for the game design process:

Roadmap to include concepts, planning and design, development, testing, distribution.

Debate the value of the concept stage including idea generation and establishing the audience, game world, narrative, style, features and gameplay, characters, storyboards and player motivation and challenges.

Recap why concepts are reviewed, synthesised and stored as a set of documents.

Investigate design tools and explore issues related to the planning and design stage including asset creation and management and possible redevelopment of agreed ideas.

Game development constraints and possible pitfalls, platforms commonly available to support development.

Testing methods, purpose of Quality Assurance (QA) and business and monetisation models, e.g. Steam, retail, Free-to-Play (F2P).

Techniques such as item-purchase, affiliate, advertising, freemium, restricted access, subscription,

Production and distribution, taking security issues into consideration.

LO4 Use game design practices and principles to create an original Game Design Document and present a High Concept pitch.

Game concept:

Gather and document a range of original game ideas using research on existing game types and styles for inspiration.

Peer-review and evaluation of feedback on game ideas.

Justify the selection of a specific game idea.

Apply game design practices and principles to develop a specific game idea into a full, well-structured concept.

Game Design Document and High Concept pitch:

Produce and quality check a Game Design Document and High Concept presentation, based on your selected concept.

Present and defend your High Concept pitch.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Critically assess the typ skills used in the design of g	es, practices, principles and games	LO1 and LO2
P1 Compare different video game types and explain key or influential titles as they were released over time.	M1 Analyse the evolution of game technology and its impact on video game design and complexity.	D1 Evaluate each section of a Game Design Document and explain the effect of game loops and Metagame design with regard to game
P2 Research the skills needed to design, create and produce a video game, and compare the roles of games animator, producer, audio engineer, director, designer, programmer and artist.		play.
LO2 Analyse the concepts a production of a Game Desig	nd elements required for the gn Document	
P3 Examine the structure of a Game Design Document.	M2 Determine the various needs and expectations of the Game Design Document stakeholders.	

Pass	Merit	Distinction
LO3 Evaluate the game design process with regard to game development and production		
P4 Create an illustrated guide explaining the video game design, development and production processes, including an evidence- based comparison between 'AAA' and 'Indie' (independent) budget allocation and development timelines.	M3 Review different game distribution channels and marketing methods used in games production.	D2 Evaluate the importance and issues related to idea generation, audience understanding, world design, narrative, style, features, gameplay, characters, storyboards and player motivation, and challenge, with regard to game design.
P5 Compare different business and monetisation models used with games production and distribution.		
LO4 Use game design practices and principles to create an original Game Design Document and present a High Concept pitch		
 P6 Create an original game concept and maintain organised evidence of giving appropriate and constructive feedback to others. P7 Develop an original Game Design Document and High Concept presentation. 	 M4 Conduct peer reviews using your original game concept and document any feedback given. M5 Develop a detailed, original Game Design Document and formally present and defend your High Concept pitch. 	D3 Critically evaluate the strengths and weaknesses of your finished video game concept, Game Design Document and High Concept pitch, and fully justify opportunities for improvement and further development.

Unit 44: Games Engine & Scripting.

Unit 43:Games DevelopmentUnit codeL/618/7479Unit level5Credit value15

Introduction

In the field of computing, games development is a multidisciplinary art form creating worlds that blend player psychology, problem solving and artificial intelligence with knowledge of dedicated hardware and software platforms. This level of ability can often require significant effort on the part of students, in terms of time and practice but as students gain more experience, their skills and abilities quickly improve. The capabilities and flexibility of a good games developer can easily be transferred to other roles in the business sector.

This unit introduces students to games development. It is designed to simulate the roles and responsibilities of a games developer working in a suitable games development studio with access to a small team of colleagues. Students will discuss and review a number of original game ideas before synthesising them into a single game concept. Once the game concept is defined, students will need to adopt appropriate methods and practices to analyse, break down and discuss the issues, then decide on, design, create and test a functional game. Students should be free to debate, evaluate and select different design and development methodologies depending on their own judgement and consideration.

Among the topics included in this unit are: game design and developer documentation, problem analysis, research, system and user requirements, design methodologies, development methodologies, unified modelling language (UML), games engines, hardware platforms, graphic manipulation, physics, maths for games, sound, networking, collision detection, teamwork, peer review, development tools and techniques, integrated development environments, debugging, testing, software versions and quality assurance.

On successful completion of this unit, students will be able to develop a Game Design Document by synthesising game ideas into an original video game concept, select and use different design and development methodologies with tools and techniques associated with the creation of a video game, work individually and as part of a team to plan, prepare and produce a functional video game including support documentation, and assess and plan improvements to a video game by evaluating its performance against its Game Design Document and original concept. As a result, they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Develop a Game Design Document by evaluating and synthesising game ideas into an original video game concept
- LO2 Use different design and development methodologies with tools and techniques associated with the creation of a video game
- LO3 Work individually and as part of a team to plan and produce a functional video game, including support documentation
- LO4 Evaluate the performance of a video game against its Game Design Document and original concept.

Essential Content

LO1 Develop a Game Design Document by evaluating and synthesising game ideas into an original video game concept

Different game genres and ideas:

Discuss and compare common game elements such as type, story, characters, environment, levels, gameplay, loops, art, sound, user interface and controls.

Determine possible game ideas including predicting the overall success of fully developing the game.

Game Design Document:

Review the value of Game Design Documents in terms of games development.

Evaluate and synthesise game ideas to describe game concept.

Research and use information relating to games testing in order to create a suitable test plan.

LO2 Use different design and development methodologies with tools and techniques associated with the creation of a video game

Design and development methodologies:

Present overviews on current design and development methodologies.

Understand strengths and weaknesses commonly associated with each methodology.

Select or synthesise a design and development methodology.

Tools and techniques:

Evaluate different tools and techniques available to create a video game.

Establish development plan, including the advantages and disadvantages of preferred or selected tools and techniques.

LO3 Work individually and as part of a team to plan and produce a functional video game, including support documentation

Team working to plan and prepare a functional video game:

Peer review and debate development plan and Game Design Document, including communicating effectively and defending ideas and reasoning.

Discuss differences with regard to the possible strengths and weaknesses of each Game Design Document and development plan.

Modify design document or plans to reflect any new insight or considerations.

Functional video game:

Use a Game Design Document with a development plan to produce a functional video game.

Create and quality check appropriate support documents.

LO4 Evaluate the performance of a video game against its Game Design Document and original concept

Performance of a video game:

Factors that influence the performance of a video games system requirements.

Critical review of the performance and development of video game against identified factors and adopted design and development methodologies.

Measure the overall success of the video game against original prediction and identify any new areas of personal insight.

Improvements to a video game:

Evaluate the overall strengths and weaknesses against original concept.

Plan revisions to implementation to improve video game's performance.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Develop a Game Design Document by evaluating and synthesising game ideas into an original video game concept		
 P1 Explore different gamebased ideas, blending them into an original video game concept. P2 Examine any areas of risk related to the successful completion of a video game. 	M1 Analyse common game design elements and combine with the original video game concept to create a suitable Game Design Document.	D1 Evaluate common game design elements and justify their use when designing a suitable Game Design Document.

Pass	Merit	Distinction
LO2 Use different design and methodologies with tools and the creation of a video game	development techniques associated with	LO2 and LO3
P3 Research the use of different design and development methodologies, tools and techniques, and determine which have been selected for the development of the video game.	M2 Compare the differences between the various design and development methodologies, tools and techniques researched, and justify a preferred selection.	D2 Evaluate any new insight, ideas or potential improvements to the concept, methodology or use of tools and justify the reasons why they have been included (or not included) as part of the development.
LO3 Work individually and as part of a team to plan and produce a functional video game, including support documentation		
 P4 Review the video game concept, preferred design, and development methodologies and selected tools and techniques. P5 Develop a functional video game based on a specified game concept and gather feedback. 	M3 Interpret the peer- review feedback and identify opportunities not previously considered. M4 Develop a functional video game based on a specific Game Design Document with supportive evidence of using the preferred design and development methodologies, and selected tools and techniques.	

Pass	Merit	Distinction
LO4 Evaluate the performance of a video game against its Game Design Document and original concept		
P6 Evaluate the performance of a video game against the original concept.	M5 Analyse the factors that influence the performance of a video game and use them to undertake a critical review of the design, development, game elements and testing stages of a video game. Conclude the review by discussing previously identified risks reflectively.	D3 Critically evaluate the strengths and weaknesses of the video game and fully justify opportunities for improvement and further development.

Unit 47:Emerging TechnologiesUnit codeR/618/7483Unit level5Credit value15

Introduction

Emerging technologies have the ability to disrupt industries, radically change the progress and thinking of humankind, affect society at large and solve huge problems. Computing underpins many emerging technologies, it allows rapid development and the sharing of ideas, products and scientific understanding across multiple fields in shorter and shorter timeframes. The objective and effect of emerging technologies is usually to change the status quo. This change might be to solve problems, increase performance, improve efficiency, or to create entirely new scientific fields and novel technologies by converging different systems, technology, thinking and disciplines. Emerging technologies include changing technologies that display radical novelty, have the potential for significant commercial or social impact and fast growth and scalability, and which affect the future in uncertain ways.

This unit introduces students to the role, benefits, disadvantages and potential outcomes that emerging technologies have in the development of software applications and business practices. The aim of the unit is to enhance students' understanding of the current types, terminology, advantages, disadvantages, potential impact and benefits of emerging technologies.

Among the topics included in this unit are classification and terminology of emerging technologies, review of the most promising and impactful emerging technologies, trends of convergence, the impact of emerging technologies on software development and an understanding of the scale, scope that emerging technologies may have on organisations their employees and the individuals served by them.

On successful completion of this unit, students will be able to explain some of the most promising and impactful emerging technologies and the advantages and disadvantages. Students will also understand the impact that emerging technologies have on the development of software applications. As a result, they will develop skills such as communication literacy, design thinking, team working, critical thinking, analysis, reasoning, interpretation and computer software literacy, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Review which emerging technologies are necessary and appropriate when designing software applications for the future
- LO2 Research an emerging technology and its impact on a given end-user group
- LO3 Develop multiple iterations of an emerging technology solution based on requirements
- LO4 Consider the ethical, social, economic and legal factors that play a role in the success of emerging technologies.

Essential Content

LO1 Review which emerging technologies are necessary and appropriate when designing software applications for the future

Formats, characteristics and trends of emerging technologies:

Overview of emerging technologies and their appropriate use in software development.

Emerging technology role, purpose and terminology.

Recognise the various forms of emerging technology e.g. educational technology, information technology, nanotechnology, biotechnology, cognitive science, robotics and artificial intelligence.

History and current trends in emerging technologies.

Characteristics of emerging technologies, how they can be used and how they differ from and converge with developed technology.

Recognise specific emerging technologies:

Current trends in emerging technologies and their use in software development and computing e.g. AI, blockchain, IoT, Virtual Reality (VR), Augmented Reality (AR).

Advantages of emerging technologies e.g. efficiency gains, increased effectiveness, new and innovative approach.

Risks of emerging technologies e.g. security and data breach risks, fairness and equity due to bias, costs could be high, ethical and legal compliance.

Emerging technologies versus disruptive technologies.

Appropriateness of using of emerging technologies to disrupt the status quo in industries, markets, user adoption and established practices.

LO2 Research an emerging technology and its impact on a given end-user group

Emerging technology impact:

Investigate specific emerging technology that will have the most impact on software application design and development.

Selection of a specific industry and end-user group that will be the most influenced by emerging technology e.g. doctors in diagnostic health setting, bankers in finance and predictive modelling.

Features of selected emerging technology:

Examination of features based on a specifically selected emerging technology to include key characteristics, area(s) of application, impact on user group and working practices e.g. change of job roles, automation, use of systems, working policies.

Contrast the features, advantages and disadvantages of chosen Emerging Technology.

Convergence:

Technologies cohabiting in a single device, sharing resources and interacting, creating new technology and convenience.

How chosen Emerging Technologies can converge with existing technologies or replace them e.g. blend of the mobile telephone and the Internet, design of hybrid vehicles.

LO3 Develop multiple iterations of an emerging technology solution based on requirements

Emerging technology solution:

Small scale prototype solution for a specific user need e.g. AI chatbot, VR video experience, IoT smart solution, 3D printing solution.

Iteration:

Understand end-user requirements by conducting a needs analysis.

Developing an initial prototype based on end user needs.

Iteration based on user feedback and testing.

LO4 Consider the ethical, social, economic and legal factors that play a role in the success of emerging technologies

Social, economic, and legal factors:

Understanding emerging technologies can produce unintended consequences.

Ability of emerging technologies to transform cultural mores and traditions, economic trends and structures, political behaviour, legal processes and principles, environmental systems and conditions.

The governance challenges associated with emerging technologies e.g. regulations, policies, laws, and constitutions staying abreast of technological advances.

Organisational decision-making process behind technological implementation including the choice between human capital and technology.

Balancing technology risks and rewards including achieving tangible benefits from emerging technologies and predicting threats associated with new innovations.

Replacing existing technologies or change ways of working:

Changes in practice e.g. Al and deep learning replacing traditional medical diagnosis methods, predictive maintenance in IT and industry versus scheduled processes, autonomous or self-driving vehicles replacing human drivers.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Review which emerging technologies are necessary and appropriate when designing software applications for the future		
P1 Review various forms of emerging technologies, focusing on their relevance to software development and computing.	 M1 Assess formats, characteristics and trends of emerging technologies. M2 Justify the ability of emerging technologies to disrupt the status quo in 	D1 Evaluate emerging technologies and justify their use when designing software applications for the future.
and risks of emerging technologies.	industries, markets, user adoption and established practices.	
LO2 Research an emerging technology and its impact on a given end-user group		LO2 and LO3
P3 Research a specific industry and end-user group that will be the most influenced by a selected emerging technology.	M3 Examine the features, of the selected emerging technology.	D2 Evaluate the solution developed including its impact on a given end user group and their current systems and working practices.
LO3 Develop multiple iterations of an emerging technology solution based on requirements		
P4 Develop a solution using an emerging technology for a given end-user group	M4 Make multiple iterations of your solution based on feedback gathered from end-user group.	

Pass	Merit	Distinction
LO4 Consider the ethical, social, economic and legal factors that play a role in the success of emerging technologies.		
 P5 Summarise the importance of considering ethics in the development of emerging technologies. P6 Discuss the influence of social, economic, and legal factors on the development and deployment of emerging technologies. 	M5 Analyse the regulatory challenges in keeping up with the pace of development of emerging technologies.	D3 Defend the adoption of emerging technologies despite the ethical, social, economic, and legal challenges.

Unit 17: Business Process Support.

Unit 50:Operating SystemsUnit codeH/618/7486Unit level5Credit value15

Introduction

Although many computer users do not interact directly with systems software and hardware, it is important that computing students have the opportunity to learn about these underlying systems.

MS-DOS, Windows, UNIX, Linux, Android, OS2, MacOS are just a few examples of different types of both modern and legacy operating systems. The foundation of most, if not all of them, is MS-DOS (Microsoft Disk Operating System). Way back in the 1980s, this was used as the first operating system for personal computers (PCs). In the 1990s, MS-DOS was transformed to a GUI (Graphic User Interface) WSWIG (What You See Is What You Get) operating system through the release of Windows 3.11/Windows for Workgroups. That has led to several iterations of the Windows Operating System.

This unit introduces students to different operating systems such as DOS, Windows, UNIX and Linux. The topics covered are: the tasks of operating systems such as controlling and allocating memory, prioritising system requests, controlling input and output devices, facilitating data networking and managing files, including security and protection.

Among the topics included in this unit are: the history and evolution of operating systems; the definition of an operating system; why operating systems are needed; how operating systems started and developed; operating systems management roles; management of memory, processes, processors, devices and files; security and protection: user security, device, application and process protection; inter-process communication; comparison of operating systems; distributed and networked systems; concurrent systems; multi-user systems; graphical interface systems; and practical application of operating systems: user interface commands of major operating systems; installations and extensions of operating systems.

On successful completion of this unit, students will be able to operate any given operating system competently and undertake routine maintenance and optimisation of operating systems. As a result, they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Investigate different operating systems, their functions and user interfaces
- LO2 Explore the processes managed by an operating system
- LO3 Demonstrate the use of DOS, Windows, UNIX and Linux
- LO4 Analyse appropriate techniques and technologies used in distributed and concurrent systems.

Essential Content

LO1 Investigate different operating systems, their functions and user interfaces

The history and evolution of operating systems:

How operating systems started and developed.

The history of operating systems from legacy operating systems to current operating systems including the development from batch files to modern operating systems.

Operating system role:

What is meant by an operating system.

Understand why operating systems are needed.

Similarities and differences between operating systems and firmware.

LO2 Explore the processes managed by an operating system

Operating systems management:

Memory management including virtual memory.

Scheduling and process scheduling in operating systems including various CPU scheduling algorithms.

Concurrent processing.

Device management.

File management.

Resource management.

The functions of IoT operating systems including overview of IoT operating systems and firmware.
LO3 Demonstrate the use of different operating systems with a range of commands

Operating system knowledge:

Commands for manipulating a range of different operating systems, e.g. MS-DOS, Windows, UNIX, Linux.

Demonstration of operating systems tasks e.g. creating or removing a directory.

Operating systems' environments, including distributed operating systems concurrent operating systems.

Security and communications:

How secure different operating systems are including different environments and the conditions of use.

Functional and logical architecture of IoT Platforms, e.g. Huawei's OceanConnect, Amazon Web Services (AWS), Google Cloud Platform, IBM Watson IoT, Microsoft Azure.

Common IoT communication protocols, CIG functions and architecture, features of IoT platforms.

LO4 Examine how operating systems will function in the future and the implications on security

Future of operating systems:

Consider desktops, laptops, smartphones and other devices in terms of operating systems development environment.

Introduction of artificial intelligence and impact on operating systems development e.g. mobile operating systems like Android and iOS equipped with Al-based voice assistants.

Connectivity e.g. Internet of things.

Support for cloud computing and outsourcing of operating system functions in the cloud.

Open source operating systems and their impact on future development projects.

Review trends in virtualisation, emulation and use of sophisticated operating systems in mobile systems.

Security e.g. biometrics.

Multi-modal interaction e.g. touch, type, speech.

User centred design.

Automation of common tasks based on user habits.

Unit 40: Client/Server Computing Systems.

Unit 51: E-Commerce & Strategy

Unit code	K/618/7487
Unit level	5
Credit value	15

Introduction

Electronic Commerce, known as E-Commerce, refers to any type of commercial/business transaction where information, data, products and services are exchanged across the internet. These transactions can cover a wide diversity of business types, including consumer-based retail sites, for example Amazon, sites that provide facilities such as auctions, for example eBay and business exchanges between different organisations. E-Commerce allows consumers to exchange goods and services electronically, 24/7 with no barriers in terms of time or geography.

This unit gives students an understanding of how and why businesses and organisations develop E-Commerce strategies to remain competitive in the global market. Students will gain appreciation of the elements and resources required to set up an E-Commerce site. They will engage in the design and implementation of strategies that would, in reality, form part of a secure E-Commerce site.

Students will examine the impact that E-Commerce has on society and the global market for consumers, buyers and sellers in terms of the benefits and drawbacks of online purchasing. Students will research the technologies involved in setting up a secure E-Commerce site in preparation for implementing their own E-Commerce strategy. Students will devise their strategy based on an element of E-Commerce, such as the design of a shopping cart, an ordering system, payment system or an online marketing system. Their design should be fully implemented and evaluated accordingly in terms of its success or failure. Students will explore standards and levels of support, marketing, CRM, promotion and supply chain management in the context of developing their implementation strategy.

On successful completion of this unit, students will have gained both a technical and practical insight into E-Commerce strategy, design and development. As a result, they will develop skills such as communication literacy, critical thinking, analysis, reasoning and interpretation, which are crucial for gaining employment and developing academic competence.

Learning Outcomes

By the end of this unit students will be able to:

- LO1 Examine E-Commerce strategies and their impact on business organisations
- LO2 Review the hardware, software, web-based and database technologies involved in setting up a secure E-commerce site
- LO3 Design an E-Commerce strategy based on a given end-user requirement or specification
- LO4 Implement an E-Commerce strategy based on a given end-user requirement or specification.

Essential Content

LO1 Examine E-Commerce strategies and their impact on business organisations

Customer expectations:

Raised expectations for a quick and efficient service, e.g. timely responses to customer communications, quick delivery of the product or service, accurate information, reduced pricing for the product/service, greater choice.

Benefits:

Wider market, niche target marketing, lower overheads and costs, greater flexibility and access to goods and services 24/7.

Drawbacks:

Visibility, security issues and threats, down-time, high se- up and maintenance costs, need to employ a technician or web-based administrator to manage the provision.

LO2 Review the hardware, software, web-based and database technologies involved in setting up a secure E-commerce site

Web architecture:

Components, e.g. server-side scripting, client/server/script interaction, operation of server-side web applications, accessing data on the web server, dynamic web pages, consistent navigational menu on all pages, browser cookies, embedding animation and video content in web pages, adding interactivity with plug-ins.

Hardware and software:

Web servers, browsers, server software, web authoring tools, database system, shopping cart software, scripting software, browser and platform compatibility. networking technology, e.g. TCP/IP, addresses, ports and protocols; domain names, multiple registration of domains (.com as well as .co.uk); setting up the server directory structure, deploying access configuration/security.

Database technology:

Uses and processes, e.g. database-driven web pages, opening a connection to a database, storing data captured from forms, performing dynamic queries on the database, generating a web page response displaying the results of a query.

Communication technology:

Uses, e.g. email support, forum; search engine optimisation; additional hardware and software components required to support communications.

Data transmission:

Features e.g. download speeds, transfer rates, bandwidth required for given applications, including text, graphics, video, speech.

LO3 Design an E-Commerce strategy based on a given end-user requirement or specification

Considerations:

Hardware and software, design and development, costs and resources, security, maintenance, customer online support and logistics.

Internet strategy:

Hosting, e.g. internal, sub-contracted; design of the website; maintaining 24/7 access.

Marketing strategy:

Methods, e.g. targeting market segments and interest groups, developing electronic 'web-communities', CRM, promotion strategies to target specific market segments, search engine optimisation, e-marketing software.

Supply chain strategy:

Methods, e.g. satisfying customer demand, responsive supply chain, managed in house or sub-contracted, developing 'partnership' relationships with suppliers.

Electronic payment:

Methods, e.g. online transaction processing, Commercial Off the Shelf Software (COTS), other payment systems, e.g. PayPal, WorldPay.

LO4 Implement an E-Commerce strategy based on a given end-user requirement or specification

Implementation:

Demonstration that the marketing, supply chain or payment-based E-Commerce strategy, e.g. designing an online ordering system or online payment system, devised has been implemented using suitable tools and applications.

Evaluation:

Evaluation of the success of the design and implementation of the E-Commerce strategy.

Technique:

SWOT analysis to evaluate the overall strengths, weaknesses, opportunities and threats of the implemented E-Commerce strategy.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Examine E-Commerce strategies and their impact on business organisations		
P1 Discuss the importance of addressing and meeting customer expectations when employing an E- Commerce strategy.	M1 Analyse organization case studies and examine how E-Commerce has been used to improve an element of business operations.	D1 Critically review the benefits and drawbacks for an organisation that is utilising E-commerce.
LO2 Review the hardware, software, web-based and database technologies involved in setting up a secure E-commerce site		
P2 Discuss the technologies involved in setting up a secure E- Commerce site.	M2 Justify the importance of communications technology in E-Commerce design.	D2 Evaluate the role that database technology plays in the development and sustainability of E- Commerce.
LO3 Design an E-Commerce strategy based on a given end-user requirement or specification		
P3 Discuss the types of strategies that could be used to drive an E-Commerce solution.	M3 Analyse the factors and resources that should be considered when designing an E-Commerce strategy.	D3 Appraise the design and functionality of the E-Commerce solution.
P4 Design an E-Commerce solution based on a specified requirement or strategy.	M4 Differentiate between the types of payment systems that are integral to E-Commerce success.	
LO4 Implement an E-Commerce strategy based on a given end-user requirement or specification		
P5 Implement a designed E-Commerce solution for an end-user based on a specified requirement or strategy.	M5 Produce a detailed SWOT analysis to support the implemented E- Commerce design.	D4 Evaluate how successful the E-Commerce implementation was and how it fulfils a specified requirement or strategy.

Unit 52:	Digital Sustainability
Unit code	A/618/5694
Unit level	5
Credit value	15

Introduction

Living and working in the 21st century in the digital technologies sector presents a range of unforeseen sustainability challenges. These challenges are based on, among other potential issues, mineral resource, ethical working and employment practices, economic impact, supply chain and climate impact.

The Brundtland Commission of the United Nations in March 1987 defined sustainability as: 'sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs'. Digital technologies is a sector in the frontline of the battle to overcome the challenges of creating a sustainable economy, but no single discipline has the capability to tackle the problems. Sustainability is a multidisciplinary challenge and technologists of the future will have to work collaboratively with a whole range of other stakeholders, such as engineers, scientists, governmental bodies and financiers, in order to find, within an urgent timescale, the practical and technological solutions needed.

On successful completion of this unit, students will have gained a wide range of knowledge and understanding of the issues and topics associated with sustainability and low impact digital technology solutions. They will have explored the interdisciplinary context of sustainability and how the development of a low carbon economy is essential in the digital technology sector. Students will have explored a current digital technology solution and evaluated its impact and potential sustainability, evaluating a range of solutions and data sources.

Learning Outcomes

By the end of this unit, students will be able to:

- LO1 Determine the nature and scope of the technical challenges, ensuring sustainability, within the digital technologies sector
- LO2 Explore the importance of collaborating with other disciplines in developing digital technical solutions to sustainability problems
- LO3 Evaluate the use of sustainable techniques in relation to their contribution to a low carbon economy
- LO4 Calculate the carbon footprint of a digital technologies' solution.

Essential Content

LO1 Determine the nature and scope of the technical challenges, ensuring sustainability, in the digital technologies sector

The scope and social context of sustainability:

Current sustainable development and digital technology challenges.

Moore's Law and the Brundtland definition of sustainability in a digital technologies context.

Impact of global demographics, trends and predictions, population growth and how this affects demand, economics, employment ethics and resource availability.

Environmental issues:

Climate change, planetary energy balance, carbon cycle science, carbon footprint of digital technologies, including: power consumption, mineral and material use, shipping, heat/energy output, packaging, recycling and safe disposal, potential pollution issues, contaminants in older equipment, low carbon power sources, corporate social responsibility and sustainable use of technologies – extending lifetime utilisation.

LO2 Explore the importance of collaborating with other disciplines in developing digital technical solutions to sustainability problems

Systems thinking and socio-technical systems:

The politics and economics of sustainability, following the principles of the Kyoto Protocol, UN Climate Change Conference (COP) and European Union Emissions Trading System (EU ETS).

Maintaining sustainable infrastructures:

Low carbon transport systems, engaging with sustainable cities and societies, using green building and built infrastructure principles, ensuring the use of low impact power generation, power storage and power distribution. Assuring low impact, sustainable logistics and maintaining a low-waste-based system.

Ethical standards:

Assuring 3rd party supplier, manufacturer and supply chain contractors all conform to current ethical sustainable and fair employment standards, along with associated legislation, e.g. ethical sourcing and disposal of end-of-life electrical equipment – Waste Electrical and Electronic Equipment (WEEE) Regulations (2013). Use of environmentally neutral, beneficial 3rd party cloud solutions, reviewing ecological credentials of cloud provisioning organisation.

LO3 Evaluate the use of sustainable techniques in relation to their contribution to a low carbon economy

Sustainable techniques:

Evaluating how digital technologies can be maintained via nuclear, solar, wind, tidal and wave, geothermal, biomass and bioenergy. Ensuring whole life cycle costing and using the precautionary principle.

Exploring the cost, power consumption and impact of digital technologies in a sustainability context, e.g. data centres, robotics in engineering, digital manufacturing, automated transport, telecommunications, health technologies, agri-tech.

Evaluate the KWH (kilowatt hour) power consumption of cloud solutions, data transmission and device use (routers, switches, servers, desktop systems, mobile computing, smart devices, wireless, wired etc.). Powering down devices when unused, reducing standby time, power consumption on 'spin up' to full utilisation.

LO4 Calculate the carbon footprint of a digital technologies' solution

Impact of digital technologies on climate:

Direct carbon emissions associated with digital technology manufacture, use and disposal. Case studies, e.g. Google Carbon Offset Data Centers, Microsoft and Ørsted offshore wind power, HP ink cartridge recycling program, NHS Electronic Prescription Service (EPS), Coca Cola manufacturing and warehouse automated robots.

Indirect positive emission effects from using digital technologies, e.g. travel substitution and transportation optimisation.

Impact that digital technologies have on behaviours and references, e.g. reshaping how we lead our lives.

Carbon footprint:

Evaluating the digital technology carbon footprint perspective, including organisational, value and supply chain, product-based challenges, current carbon footprint science, calculation of footprint based on system boundaries (limits of sphere of influence and control), geographical location, e.g. Global Carbon Project (GCP) map.

Calculation of carbon footprint, e.g. ISO 14067:2018 – Greenhouse gases – Carbon footprint of products – Requirements and guidelines for quantification.

Decarbonisation of digital technologies:

Significance of digital technology electricity consumption. Use of renewable energy, e.g. solar and wind power, to lower carbon emissions.

Impact of new and evolving digital technologies, e.g. artificial intelligence (AI).

Digital technologies as a driver of greater sustainability.

Approaches to reducing digital technologies carbon footprint, e.g. maintaining digital devices to prolong life, use digital devices for longer before upgrading, recycle/reuse equipment, consume digital services on smaller devices, charge batteries with electricity from renewable sources, purchase digital devices and services from companies that have science-based targets (SBTs), use digital technology to help to reduce carbon emissions.

Data sources:

Evaluating power consumption, manufacturers' ecological/green rating of device(s), data sheets, regional waste-management metrics, energy efficiency ratings.

Long-term sustainability:

Projecting long-term sustainability of selected digital technologies to include sustainability plan and practices, e.g. zero-carbon, carbon neutral, net-positive approach, green IT; voluntary sustainability report, stakeholder engagement.

Learning Outcomes and Assessment Criteria

Pass	Merit	Distinction
LO1 Determine the nature and scope of the technical challenges, ensuring sustainability, in the digital technologies sector		
P1 Investigate the nature and scope of the technical challenges of ensuring sustainability for the digital technologies sector.	M1 Analyse the impact of sustainability on the deployment of digital technologies.	D1 Critically analyse the interrelationship between sustainability, digital technology demand and resource availability.
LO2 Explore the importance of collaborating with other disciplines in developing digital technical solutions to sustainability problems		
P2 Explain the interdisciplinary issues associated with the construction of sustainable infrastructures, with attention to the competing pressures within these infrastructures.	M2 Analyse how political, economic and ethical standards can impact digital technical solutions.	D2 Critically analyse how a systemic approach can be used to support interdisciplinary collaboration in developing sustainable digital technologies.
LO3 Evaluate the use of sustate to their contribution to a low		
P3 Discuss the sustainable techniques that need to be considered when selecting alternative low carbon energy sources.	M3 Analyse the challenges present, when selecting low carbon sustainable techniques for a digital technology solution.	D3 Critically analyse how current digital technology solutions could be improved via the application of low carbon sustainable techniques.
LO4 Calculate the carbon footprint of a digital technologies' solution		
P4 Calculate the carbon footprint of a digital technology solution.	M4 Analyse the use of renewable energy to lower carbon emissions to support a digital technology solution.	D4 Critically review the overall carbon footprint impact and long-term sustainability of an existing digital technologies solution.
